**Abstract:** The type specimens and related specimens of the families Cerambycidae and Disteniidae (Coleoptera) deposited in the Museo Argentino de Ciencias Naturales "Bernardino Rivadavia" (Buenos Aires) are listed. Two lists are added: of type specimens mentioned as deposited in the Museum, but not found there, and of specimens labelled as types but not mentioned in the original descriptions. Specific names are alphabetically entered. All labels of the type specimens are transcribed and described. The following specimens are also recorded: specimens labelled as types deposited in other institutions; specimens not labelled as types but whose locality and other data agree with the original descriptions; specimens without type labels and localities (coll. Burmeister) or without type labels (coll. Bruch) whose typical condition is unknown or uncertain. The bibliographical references include type localities, number of specimens mentioned, collection dates, name of collectors, and the sex when stated. Nomenclatural changes (synonymies, new combinations) are also included. *Neoclytus aulai* Bruch, 1911 is transferred to *Mecometopus* Thomson, 1860.
