EPPO Reporting Service

No. 2 Paris, 2009-02-01

CONTENTS

Pests & Diseases

2009/021 - New data on quarantine pests and pests on the EPPO Alert List
2009/022 - First record of Epitrix similaris in Portugal: addition to the EPPO Alert List
2009/023 - First record of Tuta absoluta in Italy
2009/024 - Tuta absoluta caught in a tomato packing station in the Netherlands
2009/025 - Situation of Toxoptera citricida in Portugal and Spain
2009/026 - Situation of Diabrotica virgifera virgifera in France in 2008
2009/027 - Details on the situation of Rhynchophorus ferrugineus in France in 2008
2009/028 - Situation of Rhagoletis completa in Germany in 2008
2009/029 - New species of Cerambycidae identified in Israel
2009/030 - First record of Tomato torrado virus in Panama
2009/031 - First record of Tomato torrado virus in Australia
2009/032 - Tomato torrado virus: addition to the EPPO Alert List
2009/033 - Eradication of Tobacco ringspot virus from the Netherlands
2009/034 - Potato spindle tuber viroid no longer occurs in Argentina
2009/035 - Macroarray detection of potato viruses and Potato spindle tuber viroid
2009/036 - EPPO Standards on efficacy evaluation of plant protection products: a new web-based database
2009/037 - Severe outbreak of lime witches’ broom in Iran: creation of a research network (IWBDLN)

Invasive Plants

2009/038 - New records of exotic plants in Spain
2009/039 - Pathway risk analysis: invasive alien plants imported with live animals and unprocessed fibres from sheep and goats in New Zealand
2009/040 - The situation of Rudbeckia laciniata in the EPPO region
2009/041 - Delairea odorata in the EPPO region: addition to the EPPO Alert List
The pest status of *Rhagoletis completa* in Germany is officially declared as: Present, widespread in Baden-Württemberg, fewer occurrences in some other areas. In general, no eradication measures are taken.

**2009/029 New species of Cerambycidae identified in Israel**

Longhorned beetles (Coleoptera: Cerambycidae) which develop inside the wood or under the bark are easily transported over long distances by wood and wood products. The introduction of such insects into new areas may lead to their establishment, and some of them may become pests. Until now in Israel, it was considered that wood imports have led to the introduction and establishment of 3 species of Cerambycidae: *Phoracantha semipunctata* (formerly EPPO A2 List, eucalyptus borer), *Baticora rufomaculata* (fig borer) and *Xylotrechus smeii* (which was erroneously recorded as *Xylotrechus stebbingi*). Recent studies have showed that 5 new species of Cerambycidae could be added to this list of introduced longhorned beetles. *Phoracantha recurva* and *Xystrocera globosa* were collected in the wild and are thus considered as established in Israel, whereas *Chlorophorus annularis*, *Neoplocaederus basalis* and *Rhagium inquisitor* were reared on imported timber and should be regarded as interceptions only. In their paper, Friedman et al. (2008), provide the following details about geographical distribution and host plants of these insect species.

- **Intercepted species**

  **Chlorophorus annularis**

  In Israel, *C. annularis* was reared on a 2 m-long musical instrument (resembling a flute) made of a single bamboo stem, brought by a tourist from India in 1997. Approximately 100 adults emerged in May 1998. *C. annularis* is a borer of bamboo (*Bambusa, Dendracalamus, Sinobambusa, Sinocalamus* and *Phyllostachys*) which has also been reported on other hosts. In Asia it is considered as a minor pest of stored bamboo (it does not damage living plants). *C. annularis* is widely distributed in Asia, and also occurs in Oceania. It has been intercepted in North America and Europe on consignments of bamboo and bamboo products.

  **Asia:** Cambodia, China (North-East and South including Hainan Islands), East Timor, India (Assam, Punjab), Indonesia (Java, Sumatra), Japan (including Ryukyu and Bonin Islands), Korea Republic, Laos, Malaysia (West, Sarawak), Myanmar, Nepal, Philippines, Singapore, Sri Lanka, Taiwan, Thailand.

  **North America:** USA (Hawaii).

  **Oceania:** Australia, Guam, Northern Mariana Islands, Papua New Guinea.

  **Neoplocaederus basalis**

  In Israel, *N. basalis* was reared on a tree trunk imported from West Africa to the port of Haifa (2 adult specimens emerged in July 1966*). This insect is reported to occur in West, Central and East Africa.

  **Africa:** Angola, Benin, Cameroon, Côte d’Ivoire, Nigeria, Tanzania, Uganda.
Rhagium inquisitor
In Israel, *R. inquisitor* was reared from one larva found in December 2006 under the bark of a tree trunk imported from Russia (the adult emerged in May 2007). This species is a pest of conifers (*Abies, Larix, Picea, Pinus*), and is occasionally found on broadleaved trees (*Betula, Fagus, Quercus, Populus*). It is reported from Europe, Northern Asia (excluding China) and North America (Canada, USA).

- Established species

Phoracantha recurva
In Israel since 2001, 3 specimens have been collected in natural habitats, sometimes near eucalyptus, in lower Galilee, Samaria and the Central coastal plain, but is it likely that it has spread to other areas. *P. recurva* is a pest of eucalyptus trees which originates from Australia but which has largely expanded its range of distribution during the last 20 years. **EPPO region**: Israel, Greece, Morocco, Spain, Tunisia. **Africa**: Malawi, South Africa, Zambia. **South America**: Argentina, Brazil, Chile, Uruguay. **Oceania**: Australia, New Zealand, Papua New Guinea.

Xystrocera globosa
In Israel, *X. globosa* was first detected in Nizzanim (March 2002) and Tel Aviv (June 2006). It has now become abundant in the Southern coastal plain, developing in the wood of ornamental Fabaceae trees. *X. globosa* is a pest of Asian origin which attacks a wide range of wild and cultivated trees belonging to Fabaceae (*Acacia, Albizzia, Bauhinia, Cassia* etc.), Malvaceae (*Grewia, Salmalia*) and Rosaceae (*Prunus*). **EPPO region**: Egypt, Israel. **Africa**: Egypt, Madagascar, Mauritius (including Rodrigues Island), Seychelles. **Asia**: India (including Andaman Islands), Indonesia (Java, Sulawesi, Sumatra), Japan, Laos, Malaysia, Myanmar, Pakistan, Philippines, Republic of Korea, Saudi Arabia, Sri Lanka, Taiwan, Thailand. **North America**: USA (Hawaii). **Central America and Caribbean**: Puerto Rico. **Oceania**: Australia (Northern Territory), Papua New Guinea.

* These specimens were ‘rediscovered’ after the insect collection to which they were added in 1966 was moved to another place in Israel.
