AND LEPTURINAE (COLEOPTERA: CERAMBYCIDAE )  
FROM THE PATRIMONY OF “GRIGORE ANTIPA”  
NATIONAL MUSEUM OF NATURAL HISTORY (BUCHAREST)  
(Part I)**

*To Dr. Nicolae Săvulescu's memory*

RODICA SERAFIM

**Abstract.** The catalogue includes data on 25 Palaearctic species of Cerambycidae coleopterans of the subfamilies Prioninae (tribes Prionini and Aegosomatini) and Lepturinae (tribes Oxymirini, Xylosteini, Rhamnusiini and Rhagiini) preserved in the collections of „Grigore Antipa” National Museum of Natural History.

**Résumé.** Le catalogue content des données sur 25 espèces paléarctiques de coléoptères Cerambycidae des sous-familles Prioninae (les tribus Prionini et Aegosomatini) et Lepturinae (les tribus Oxymirini, Xylosteini, Rhamnusiini et Rhagiini) conservées dans les collections du Muséum National d’Histoire Naturelle «Grigore Antipa».

**Key words:** Coleoptera, Cerambycidae, catalogue, collections, „Grigore Antipa” Museum.

In the entomological collections of „Grigore Antipa” National Museum of Natural History from Bucharest there are preserved 25 Palaearctic species of Cerambycidae coleopterans of the subfamilies Prioninae (tribes Prionini and Aegosomatini) and Lepturinae (tribes Oxymirini, Xylosteini, Rhamnusiini and Rhagiini).

The collection includes:

- Materials from the old coleopteran collection from the Palaearctic region (which gathers specimens aquired between 1883 – 1950 from Canisius, Kenderessy, Fleck, Deubel, Montandon, Várady collections) (8%)
- Material from Dr. Nicolae Săvulescu’s collection, aquired between 1961–1982 (29%)
- Materials, from the same collection, included in the „Grigore Antipa” Museum patrimony in 1992, after Dr. Nicolae Săvulescu’s death (cca 12%)
- The specimens received by material exchanges with the specialists and collectors from abroad (1%)
- Materials collected by the specialists of the „Grigore Antipa” Museum and their collaboratories during the field trips, between 1945–2004 (50%).

A large part of the information given by the specimens from collections were materialized by scientifical papers.

The first data on the materials from the personal collections, which are now included in the Museum patrimony, were published in Montandon’s (1884, 1906) and Fleck’s papers (1905).

---

English translation by Mihaela Barcan Achim.

Panin and Săvulescu (1961) used the little material collected till 1960 to publish the Cerambycidae volume in the "Romanian Fauna" series.

The collections of Cerambycidae obviously increased after this date. The first step of the collection increasing was the aquiring of a part of Dr. Nicolae Săvulescu's collection, a part where most of the material was described in the fascicle of fauna. Gradually, in 1978, 1979 and 1982, other three parts were aquired, whose most of the data were not published since now.

The collections developed a lot after 1962 due to the material collected all around Romania during different field trips made by the scientists of the Department of Entomology and their collaboratories. Among the researched areas we can mention the Danube Delta, Dobrogea, Vrancea County, the Romanian Plain, Satu Mare County, Maramureş County, Banat, Piatra Craiului Mountains, Făgăraş Mountains, etc. A part of the data given by the material of the collections were published by Negru & Roşa (1967), Serafim (1985, 1993, 1997 a, b, 1998, 1999, 2004), Serafim & Maican (2003, 2004).

After Dr. Nicolae Săvulescu's death, in 1992, his collection (unsold) was given to the Museum. For the time being, the material is studied (a part of its data is presented in this catalogue).

The catalog presents 25 Palaearctic species of Cerambycidae, of the subfamily Prioninae (tribes Prionini and Aegosomatini) and of the subfamily Lepturinae (tribes Oxymirini, Xylosteini, Rhamnusiini and Rhagiini), represented by 1,941 specimens. Most of the material originates in Romania. Also, in the collection there is a material from France (*Megopis scabricorne*, *Rhagium bifasciatum*, *Rh. sycophanta*, *Rh. inquisitor*, *Pidonia lurida*), Italy (*Rhamnusium bicolor*), Czechia and Poland (*Akimerus schaefferi*, *Brachyta interrogationis*), Russia (*Carilia virginea*), Hungary (*Dinoptera collaris*). The species belonging to the Romanian fauna, from the tribes mentioned in the paper, are present in the Museum collections. An exception is the species *Acmaeops septentrionis*, whose presence in the Romanian fauna has to be confirmed. *Microarthron komarowi* and *Rhagium fasciculatus* are represented only by a foreign material.

The nomenclature and the systematical displaying are according to Danilevsky's paper (2004) – „Systematic list of longicorn beetles (Cerambycoidea) of Europe”.

## DISCUSSIONS

The specimens, originating in the collections acquired at the end of the 19th century and at the beginning of the 20th one, do not have all collecting data. But they are preserved for their historical value. We know that the specimens from Deszö Kenderessy's collection, amateur entomologist from Transylvania, were collected at the end of the 19th century, from Hațeg tableland. The materials from Eduard Fleck's collection (amateur entomologist from Azuga) were collected especially from the Bucegi Mountains, most of them from Azuga, collection being acquired in 1914. Most of the specimens of Fridrich Deubel's collection (amateur entomologist from Brașov), acquired in 1923, are from the outskirts of Brașov. Localities are mentioned on labels, but without other collecting data. The same problems raises for Arnold Lucien Montandon's collection, which consists of materials collected from the royal land property from Broșteni, Comana or Dobrogea, at the end of the 19th century and the beginning of the 20th one.

From the subfamily Prioninae, *Prionus coriarius* (Prionini) and *Megopis scabricornis* (Aegosomatini), common species, are well represented within collections.

The East-Palaearctic species, *Microarthron komarowi* (Prionini), was collected in Baigakum, Kazakhstan.

From Lepturinae, *Oxymirus cursor* (Oxymirini), *Rhagium mordax*, *Rh. sycophanta*, *Rh. inquisitor*, *Stenocorus meridianus* and *Anisorus quercus* (Rhagiini) are well represented within collections.

Relatively a few data on the species *Xylosteus spinolae* are published: Sinaia (Peleș Castle) and Negoiu (Montandon, 1906); Preajba, Buzăului Mts (Petri, 1912); Brașov, Tarcău, Gheorghieni, Cibinului Mts, Negoi (Făgărăș Mts), Prăpastea (Piatra Craiului Mts) (Panin & Săvulescu, 1961); Băile Herculane, Domogled (Kovács, Hegyessy & Medvegy, 1998–1999); Voineasa, near Obârșia Lotrului (Ruicănescu & Patko, 1995); Valea Cernei (Ruicănescu, 1997). To all these we add the data given by the specimens from the collections of the Museum: Bicaz, Retezat Mts (Baleia chalet), Bucegi Mts, Jepi.

*Rhamnusium bicolor* (Rhagiini) was recorded at Comana and Dobrogea (Fleck, 1905), Zau de Câmpie, Cluj, Brașov, Sibiu, Făgărăș, Rodna Mts (Petri, 1912), Pitești, Bârnova, Tecuci, Budești, Comana (Panin & Săvulescu, 1961), Sucevița, Dorohoi (Andriescu, 1972), Cozla hill, Piatra Neamț (Serafim & Apetrei, 1996). The specimens preserved in the collections of the Museum offer new collecting data: Tecuci, Budești and Comana.

*Rhagium bifasciatum* was recorded in Cluj (Petri, 1925–1926), Craiova, Ineu, Sibiu, Tulgheș, Făgărăș Mts, Râșnov Mts (Panin & Săvulescu, 1961). After the fauna fascicle was published, the species was also found at Negrești Oaș, in 1964 (specimen preserved in the collections of the Museum). It was not recorded for 40 years.

In 1961, in the fauna fascicle (Panin & Săvulescu, op.cit.), the authors anticipated the presence of *Akimerus schaefferi* in Romania. Its presence in the Romanian fauna was confirmed by Andriescu (op. cit.), in 1972, who recorded it at Păltinoasa (Suceava County). The species was found later on by Dr. Nicolae Săvălescu, in Mehedinți County, at Ghelmegeiaia, in 1972, and at Gura Văii, in 1978. Collecting data of these specimens (preserved in the collections of the Museum) are presented for the first time now. In 1992, Ruicănescu found the species in Oglănicului Valley, botanical reservation downstream Gura Văii.

*Brachyta balcanicus*, rare species, Balkan endemic species, was recorded only from Dobrogea, from Murfatlar (Fleck, 1905) and from Agigea (Panin & Săvulescu, op.cit). Collecting data of the specimens of the collection offer new information on the distribution of the species in Romania. In Dobrogea, the species was collected from Murfatlar (1962), Hagieni (1985 – 1991), but also from Gura Apei, Retezat Mts (1956) and from Șelimbăr, Sibiu County (1963 – 1965).

In 1903 and 1904 Csiki cited the species *Brachyta interrogationis* from Cindrel (Cibin) Mountains, Măgura Cisnădiei, Lotrișoara, Tușnad, Mehadia. In Deszo Kenderessy's collection there is a specimen, but, unfortunately, it has no collecting data.

Taking into consideration the distribution of *Evodinellus borealis* we do not reject the idea of its presence in Romania.

*Evodinellus clathratus*, *Gnathacmaeops pratensis*, *Dinoptera collaris*, *Carilia virginea* and *Pidonia lurida* are well represented within collections.

As regards *Pseudogaurotina excellens*, Carpathian endemic species, it was less mentioned in literature: Transylvania, without other mentions (Petri, 1912), Retezat and Cindrel mountains – Gura Râului in the Cibin river (Petri, 1925 – 1926), Gura Apei, Râul Mare valley, Retezat Mts (Panin & Săvulescu, 1961). In 1996, a specimen was collected from Săpânța, in Maramureș (Serafim, 1997 b). The specimens from Gura Apei and from Săpânța belong to the collections of the Museum.

#### ACKNOWLEDGEMENTS

I thank Dr Mihai Stănescu and Mr. Alexandru Iftime for photographies and anonymous reviewers for improving the manuscript.

#### CATALOGUL SPECIILOR PALEARCTICE DE PRIONINAE ȘI LEPTURINAE (COLEOPTERA: CERAMBYCIDAE) DIN PATRIMONIUL MUZEULUI NAȚIONAL DE ISTORIE NATURALĂ „GRIGORE ANTIPO” (BUCUREȘTI) (Partea I)

#### REZUMAT

Catalogul cuprinde datele referitoare la 25 de specii palearctice de coleoptere cerambycide din subfamiliile Prioninae (triburile Prionini și Aegosomatini) și Lepturinae (triburile Oxymirini, Xystosteni, Rhamnusiini și Rhagiini) păstrate în colecțiile Muzeului Național de Istorie Naturală „Grigore Antipa”. Dintre acestea se remarcă speciile *Xylosteus spinolae*, *Rhamnusium bicolor*, *Rhagium bifasciatum*, *Akimerus schaefferi*, *Brachyta balcanicus* (endemit balcanic), *Brachyta interrogationis*, *Pseudogaurotina excellens* (endemit carpatic). Speciile cunoscute ca făcând parte din fauna României, din triburile menționate în lucrare, sunt prezente în colecțiile Muzeului. Având în vedere răspândirea speciei *Evodinellus borealis* nu excludem posibilitatea prezenței acesteia în fauna României.
